

dCache - protocol developments and plans

Paul Millar

(on behalf of the dCache team)

2015-01-13 pre-GDB: on Data Management & Data Preservation

Why am I here?

- We, WLCG, are re-evaluating the "protocol zoo"
- From a dCache point-of-view:
 - dCache provides significant storage for WLCG.
 - dCache provides significant storage capacity for many other communities.
- The dCache team needs to be efficient not waste resources.

as a consequence, the dCache mantra

Use standards.

What should we do with SRM?

- There has been considerable investment in SRM,
- SRM has some unique features:
 - Transfer protocol negotiation,
 - Asynchronous operations,
 - Bulk operations,
 - Transactions / 2-stage-commit upload.
 - (Space reservations, Access-Latency, ...)
- Battle tested, with over 10 years of production use
 - → it works.

SRM unique features

If WLCG continues to makes use of SRM unique features then it must either:

- Continue using SRM for those unique features
- Invent a new protocol to support unique features
 (NB. a protocol extension == a new protocol)

Inventing a new protocol is **bad**: takes effort away from all software teams

WLCG has a finite effort → implementing a new protocol means all WLCG storage will suffer.

Recommendation: if WLCG uses SRM-unique features then stay with SRM for those features

We (dCache) are continuing to improve SRM, both server and client.

Non-unique SRM features

Storage accounting (WebDAV+RFC-4331)

Not equivalent, but if space-reservations tied to namespace, it may be used instead. Along with DPM, we plan to implement support for this.

- Direct data transfers (not actually an SRM feature)
 - Suggest using WebDAV for WAN and NFS for LAN (like GPFS+StoRM).
 - We plan to drop dcap support once NFS is proven to work in production.
- 3rd party transfers (FTP, WebDAV+extension, xrootd+extension, NFSv4.2)

Solution space is quite complex. Suggest using FTP for now and watch how WebDAV develops. N.B. SRM two-stage commit can prevent dark data.

Namespace operations (FTP, WebDAV, xrootd, NFS)

Recommend bulk operations use SRM; for a "small" number of operations, any protocol is fine – suggest WebDAV or NFS if available.

WebDAV

- We have added 3rd-party transfer support
 - Supports current specification.
 - Working with FTS/DPM developers to verify this.
 - Some limitations of the current approach, some development may be needed.
- Will be adding support for RFC 4331.
 - Provides information like du -ks <directory>.
 - For many VOs, may be a substitute for SRM space accounting.

NFS

- Deployed at DESY for CMS (WNs and NAF) and other users:
 - "Interactive" NAF has CMS permanently mounted.
 - Grid WN was for a limited period, with some fraction of WNs using NFS.
- Operations are basically OK, but performance is under investigation.
 - When network is working well, performance is comparable with dcap Statistics show a slight decrease in performance, but a good starting point.
 - NFS protocol also allows the clients (WNs) reading data through the door, which is used as a fall-back if there's a problem. This works, but there is a large impact on performance. We're working on this by:
 - tuning the client to be more resilient to minor, transitory problems,
 - reducing this impact when the client falls back and reads through the door.

xrootd

- Plugins allow communities to extend basic functionality:
 - CMS, ATLAS and ALICE make use of this
 - Used for monitoring, name-to-name translation (federation), access-control, redirection, ...
 - Plugin framework will change in the near future: dCache v2.12 (~1st March) or v2.13 (~1st July) (don't panic)
- 3rd-party copy: currently no road-map.

Authentication

- Many people looking at SAML (or OpenID-Contect) to replace X.509
 - dCache team are investigating this in collaboration with LSDMA, EGI FedCloud and OGF.
- Medium term solutions will likely involve gateway services:
 - Infrastructure continues to use X.509; online CAs generate X.509 certificates.
 - Does not exclude any of the listed protocols.

One more thing...

Prometheus

The goal:

try to discover bugs before software hits production services

• The problem:

We can't test all (ATLAS, CMS, LHCb, Alice, ...) use-cases.

The offer: prometheus.desy.de

A test instance, rebuilt daily (data is lost overnight),

Always the tip of development branch (currently 2.12.0-SNAPSHOT),

Anyone from atlas, cms, lhcb, alice and dteam VOs can use this service right now.

Verify their software-stack works with the next major-version dCache.

Bug-fixes (which will be rolled out on production services) are available first in prometheus.

If you're interested, start testing – contact me if there's any problems.

Thanks for listening, any questions?
